706441US6

AMENDMENTS TO THE SPECIFICATION

Please replace paragraph [0026] on page 4 with the following paragraph:

Referring to Figure 56, as the articulated base 180 is rotated 180 degrees, pins/rollers 182, 184 have switched places in guide track 150, and are in position to engage the apertures (not shown) to lock the base 180 in the inverted position. Folded seat cushion 110 and back 120 are fully housed in storage receptacle 140, and articulating arm 170 and floating pivot 172 have returned to their original positions. Articulated base 180 further includes a flat underside 186 that, with articulated base 180 inverted, forms a continuous surface with vehicle load floor 20.

Please replace paragraph [0028] on page 4 with the following paragraph:

Articulating arm 270 according to the further embodiment of the invention is mounted in a remote corner of receptacle 140, compared to arm 170 mounted inside of track 150. In order to avoid interference with pin/roller 182 as it traverses guide track 150, articulating arm 270 is positioned outwardly of guide track 150, as shown in Figure 8.
